

Agriculture Research Intelligence System

Field-trial research software, built for the field.

A modern desktop app — plus a phone that captures assessments, notes, and photos **offline in the field** and syncs back automatically. Design trials, collect data, run the stats, and send the report, all in one place.

WHAT ARIS DOES

Design the trial

Protocols, treatments, RCBD/CRD randomization, and plot maps in minutes — not wrestled together in Excel.

Capture data offline

The phone app logs assessments, notes & photos with GPS and time — no signal needed. Syncs when you're back online.

Stats & reports built in

ANOVA, LSD mean separation, trial maps, and client-ready reports without exporting to a second tool.

One connected system

Field captures flow straight into the trial record on your computer. No re-keying, no lost clipboards.

LEGACY TRIAL TOOLS

- Desktop-only; paper in the field
- Re-key field data at the office
- Export elsewhere for stats
- Interfaces a decade behind

ARIS

- Phone captures data **offline**, auto-syncs
- Notes & photos flow into the trial
- Stats, maps & reports built in
- Clean, fast, made this decade

"Legacy trial software is slow and fights you in the field. ARIS is the modern alternative — design the trial, capture data offline on your phone, run the stats, and send the report, all in one connected system. Now onboarding a first group of researchers, CROs, and PCAs."

See it live — request early access

Free demo + a trial season during the beta. We just want your feedback.
